Contents

Table of Cases	xv
List of Figures	xix
Acknowledgments	xxi
Introduction	xxiii
Chapter 1 · Using Forensic Evidence to Prove Ultimate Issues	3
Overview	3
Chapter Objectives	4
What Is Forensic Evidence?	5
How Is Forensic Evidence Used in Criminal Trials?	5
Proof of Ultimate Issues	6
Standard of Proof	7
Identification	7
Proving What Happened	7
Individual vs. Class Characteristics	8
Science vs. Junk Science	10
Qualifications of the Forensic Expert and Freedom from Bias	10
Eyewitness Identification	11
Rules Governing Admitting a Forensic Expert’s Testimony	11
Federal Rules of Evidence 703 and 705	12
Chain of Custody	13
The Expert “Opinion”	13
Jury Instructions on Expert Testimony	14
Forensic Evidence Is Circumstantial Evidence	14
Case Study in Circumstantial Evidence: The Richard Crafts Case	18
Were Helle’s Statements Admissible under the Hearsay Rule?	19
Fingernail, Hair, Fiber, Tooth, and Tissue	20
Standard of Proof Where One Inference Depends on Another	21
Circumstantial Evidence in the <i>Grant</i> Case	26
The Handkerchief	27
Summary	28
Discussion Questions	29

Chapter 2 · The Court Process: Procedure, Law, and Rules of Evidence	31
Overview	31
Chapter Objectives	33
The Rules of Evidence Govern the Admission of Evidence	33
State and Federal Courts Have Different Rules	33
The Role of the Courts in Admitting Evidence	34
Motions	34
Motions in the <i>Grant</i> Case	35
Grant’s Motion to Exclude DNA Evidence	35
Grant’s Motion to Exclude His Statement to Police	35
Grant’s Motion during Trial for a “Mistrial”	36
Grant’s Motion for New Trial	36
General Principles of Law Applicable to Criminal Trials	36
The Effect of a Not Guilty Verdict	36
More than One Trial Can Result from the Same Set of Facts	37
Double Jeopardy Applies Only to Acquittal of the Same Crime	37
The Effect of the U.S. Confrontation Clause on Which Witnesses	
Must Testify	38
The Meaning of Precedent	41
The Jury Is the Finder of Fact	42
Rules of Evidence Governing What Evidence Can Be Admitted	42
Pretrial Procedure	42
Relevance	43
Undue Prejudice	44
Was a Prosecution’s DNA Testimony Unduly Prejudicial?	45
Evidence of Prior Crimes Is Generally Not Admissible	45
The Defendant Is Not Required to Testify	46
Rules Relating to Forensic Expert Testimony	48
Judicial Notice	48
Appeals	49
Federal Court System	49
State Courts	50
Harmless Error Rule and Abuse of Discretion Standard	51
Possible Rulings on Appeal	51
Habeas Corpus Appeals	52
Summary	54
Discussion Questions	55
Chapter 3 · Crime Scene Investigation	57
Overview	57
Chapter Objectives	58
How Forensic Evidence Is Processed	58
Locard’s Exchange Principle	59
On-Site Investigation	59

Laboratory Testing	61
Do Juries Expect Forensic Evidence?	63
Crime Scene Drawings	64
Chain of Custody	67
The Chain of Custody in the <i>Grant</i> Case	70
Linking Forensic Evidence to Witness Statements	71
Missing Evidence	72
Expert Qualifications	72
No Experts for the Defense	73
Claims of Ineffective Counsel Based on Crime Scene Experts	74
Summary	75
Discussion Questions	76
Chapter 4 · The Scientific Method and “Junk Science”	77
Overview	77
Chapter Objectives	78
What Is the Scientific Method?	79
Defining the Relevant Scientific Community	81
Determining the Error Rate	81
The “Science” of Inclusion, Exclusion, and Identification	82
Replicability and Absence of Subjective Judgment	83
What Is the Scientific Hypothesis?	83
Fingerprints	83
DNA	85
Eyewitness Identification	86
What Is Junk Science?	86
Forensic Evidence that Lacks Sufficient Scientific Studies	88
Firearms and Toolmarks	88
Bite Marks	90
Knife Prints	93
Shoeprints	94
Palmprints	95
Lip Prints	95
Polygraph	96
Is “Neuroimaging” a More Scientific Form of Measuring Knowledge?	97
Psychological Expert Testimony	100
Post-Mortem Hair Banding	101
Can Your Smell Identify You?	102
Can a Computer Identify Your Handwriting?	102
Summary	102
Discussion Questions	103

Chapter 5 · The General Acceptance Rule and the <i>Daubert</i> Case	105
Overview	105
Chapter Objectives	106
The General Acceptance Test	106
The <i>Daubert</i> Rule	108
Remand of the <i>Daubert</i> Case	112
<i>Daubert</i> Requires Gatekeeper Hearings	113
The Gatekeeper Process	115
How State Courts Reacted to <i>Daubert</i>	117
Standard of Appellate Review Is Abuse of Discretion	118
<i>Kuhmo</i> Extends <i>Daubert</i> to “Technical” Testimony	118
Post- <i>Daubert</i> Issues	120
Is “Science” Developed Specifically for Litigation Suspect?	120
Is General Acceptance Alone Sufficient for Admissibility?	122
How Well Do Trial Judges Understand Science?	123
Post- <i>Daubert</i> Decisions	124
Summary	125
Discussion Questions	126
Chapter 6 · Fingerprint Analysis	129
Overview	129
Chapter Objectives	130
The Evolution of Fingerprint Identification	131
The Process of Fingerprint Identification	134
Obtaining the Crime Scene Print	134
Getting Prints from a Suspect	135
Comparing Ridge Characteristics and Minutiae	135
The ACE-V Method of Fingerprint Comparison	137
Analysis	137
Comparison of Prints	138
Evaluation	139
Verification	139
Opinion	139
Automated Fingerprint Identification System (AFIS) Matching	140
Isolating the Print	140
Identifying the Ridge Characteristics	141
The Computer Search	141
History of Use of Fingerprints in Court	144
The <i>Llera Plaza</i> Case in 2002	146
Whether the Theory or Technique Can Be Tested	147
Peer Review	148
Rate of Error	148
Controlling Standards	149
General Acceptance	149

Cases on Fingerprints after <i>Llera Plaza</i> and before the NRC Report	150
The NRC Report in 2009	151
Changes in Fingerprint Identification Technology	153
Fingerprint Identification Mistakes	155
Fingerprints in the <i>Grant</i> Case	158
Should One Fingerprint Have Been Corroborated?	158
Summary	161
Discussion Questions	163
Chapter 7 · DNA	165
Overview	165
Chapter Objectives	166
The Process of DNA Profile Analysis	167
What Is DNA?	167
DNA Typing — A Quickly Changing Technology	167
The Principles of DNA Testing	167
Restriction Fragment Length Polymorphism (RFLP) Testing	169
DNA Testing Improves with Short Tandem Repeats (STR)	170
Polymerase Chain Reaction (PCR) “Copies” Small DNA Samples	170
The Role of Statistics in DNA Profiling	171
DNA Testing of Degraded Samples	172
The Use of DNA Testimony in Court	173
Early Court Challenges to DNA Test Results	173
“Judicial Notice” of DNA Testing	173
A <i>Daubert</i> Hearing Is Not Required to Challenge Errors in a Particular	
DNA Test	174
The Expert Opinion in Court on a DNA “Match”	175
Avoiding the “Prosecutor’s Fallacy”	175
“Cold Hit” DNA	177
DNA Evidence in the <i>Grant</i> Case	178
Porter DNA Hearing in <i>Grant</i> Case	181
Challenges to New DNA Technologies	182
Touch DNA Evidence	182
Rapid Testing DNA	187
<i>Daubert</i> Hearings on Mitochondrial DNA	188
Making an Argument that DNA Was “Planted”	190
Objections Based on Poor Laboratory Procedures	191
The Confrontation Clause and the Right to Examine DNA Testers	192
What Objections Are Left to Refute DNA Profiles?	197
Summary	199
Discussion Questions	200

Chapter 8 · Firearms and Toolmarks	203
Overview	203
Chapter Objectives	203
Case Study	204
Firearms	204
Class Characteristics	205
Sub-Class Characteristics	205
Individual Characteristics	206
Characteristics Based on Wear	206
Bullets	206
Casings	207
NIBIN	209
The State of the Law	210
Other Firearms-Related Forensics	220
Gunshot Residue	221
Toolmarks	223
Summary	226
Discussion Questions	226
Chapter 9 · Computer and Digital Forensics	227
Overview	227
Chapter Objectives	227
Case Studies	228
<i>State v. Lasaga; U.S. v. Lasaga</i>	228
Connecticut's Most Expensive Divorce	229
Types of Cases	230
Types of Data	231
Location Data and Identification Data	231
IP Addresses	231
EXIF Data	232
Substantive Evidence	233
Internet Searches	233
Private Browsing	234
Contraband	234
Other Crimes	235
CMOS Data	235
Evidence of Destruction	235
Obtaining the Data	236
Legal Requirements	236
Forensic Recovery	237
A Word about Computer Operations	237
Authentication	239
Acquiring the Data	240
First Responders	241

A Word about ROM and RAM	242
Cell Phone Data	243
Substantive Evidence	243
Identification Data	243
Location/GPS Data	244
Pictures	248
EXIF Data	248
Legal Issues	249
Authentication of Data	249
Search and Seizure	250
Relevance	251
Electronic Discovery	252
Federal Rules of Civil Procedure	253
Methods	254
Summary	255
Discussion Questions	255
Chapter 10 · Eyewitness Identification	257
Overview	257
Chapter Objectives	259
Why Is Eyewitness Testimony Unreliable?	260
Eyewitness Errors in Exoneration Cases	260
The Historical Legal Standard for Eyewitness Identification	262
Jury Instructions	269
Problems with Lineup Procedures	270
Proposed Lineup Reforms	271
Are There Enough Experts on Eyewitness Error to Testify?	271
Admissibility of Composite Sketches	271
The Modern Approach after <i>Daubert</i>	272
The “Special Master” Approach	273
The “Study Group” Approach	275
How Memory Works	276
Variables Affecting Memory	277
Juror Understanding	280
Addressing Issues in Eyewitness Identification	281
Jury Instructions	281
Cross-Examination	286
Pretrial Hearings	287
Expert Witnesses	287
Closing Argument	292
Disallow	292
In-Court Identification for the First Time	292
The Future of Eyewitness Identification	295
Facial Recognition Technology	295

Summary	297
Discussion Questions	297
Chapter 11 · Blood Spatter Analysis	299
Overview	299
Chapter Objectives	300
What Is Blood Spatter?	300
Blood Spatter Analysis — What Is the Scientific Hypothesis?	301
Methods of Determining Patterns	303
Is Blood Spatter Expert Testimony Reliable?	304
Reliability Rulings	304
Bloodstain Analysis in Crime Reconstruction	306
Does a “Hypothetical Opinion” Solve the Problem?	308
Challenges to Expert Qualifications	310
Blood Spatter “Experiments” Inadmissible	312
Case Study: The <i>Sam Sheppard</i> Case — Blood Spatter in a Brutal Killing	315
Blood Spatter in the <i>Grant</i> Case	319
Summary	319
Discussion Questions	320
Chapter 12 · Handwriting and Questioned Documents	323
Overview	323
Chapter Objectives	324
The Traditional Handwriting Analysis Process	325
Traditional Handwriting Analysis Is a Subjective Process	326
The Role of Training and Experience	327
Is Handwriting Analysis a Reliable “Science”?	327
Is There Any Proof That Handwriting Is Unique?	328
What Characteristics Are Most Useful in Distinguishing Handwriting?	329
Are More Common Characteristics Required in Identifying the Source of Disguised Writing?	329
Gathering Exemplars	330
Examine Pictorial Similarities	330
Look for Individuating Characteristics	330
Forgeries	330
Disguise	331
The Handwriting Expert’s Opinion	331
What Characteristics Do Experts Look For?	331
The Admissibility of Handwriting Expert Testimony	332
Handwriting Analysis after <i>Daubert</i> but before <i>Kuhmo</i>	332
Admissibility after <i>Kuhmo</i>	334
Disguised Writing	335
Rejections Based on Lack of Expert Qualifications or “Common Knowledge”	336

Expert May Point Out Differences, but Not Give an Opinion	336
Reliability and Error Rate	341
Handwriting Testimony Found to Meet <i>Daubert</i> as Reliable	344
Does Scholarly Disagreement Show Lack of General Acceptance?	347
Court Decisions after the NRC Report	348
Will Computer Handwriting Analysis Meet the <i>Daubert</i> Test?	351
Ransom Notes — From Lindberg to JonBenét	353
Who Wrote the JonBenét Ramsey Ransom Note?	355
Summary	362
Discussion Questions	363
Chapter 13 · Exonerations of the Wrongly Convicted	365
Overview	365
Chapter Objectives	366
The Innocence Project	367
Who Are the Exonerated?	367
Laws to Preserve DNA Evidence	368
What Is the Process Leading to Exoneration?	369
Getting the Conviction Reversed	373
One State's Approach	373
Federal Law	374
The Role of Eyewitness Misidentifications and Reform Efforts	375
Are the New Statutes Too Little, Too Late?	376
Claims Based on Failure to Test DNA Evidence	376
<i>House v. Bell</i> — A Reversal Based on Improper Blood Testing	380
Exoneration and Post-Conviction Mitochondrial DNA Testing	383
Can Exonerees Sue for Money for Wrongful Imprisonment?	384
How Does the Exoneree Return to Society?	386
James Tillman	387
Summary	388
Discussion Questions	389
Appendix · The <i>Grant</i> Case Study and Record	391
Overview	391
The Investigation	392
The Trial and Appeal	392
Detailed Record	397
Theory of the Case	397
Semen	398
Suspects	398
Eyewitness Reports	399
Forensic Evidence	399

Acknowledgments

Thank you to the University of Hartford, where I first developed the course in forensic evidence in court, from which this text is developed. I am grateful to my colleague, Marc Vallen, who generously accepted my request to lend his expertise in digital forensics to the preparation of this second edition, and who later agreed to update our chapter on eyewitness identification and add a chapter on firearms and toolmarks. And I wish to thank Lawrence Lissitzyn, my husband and an attorney, who read and re-read chapters, researched Confrontation Clause issues, and was helpful in innumerable ways.

—CBL

I wish to thank, first and foremost, my darling wife Erica, who in addition to providing much needed moral support, tolerated me throughout this project, particularly as deadlines approached. Much gratitude to my children, Marc, Olivia, and Tessa, each of whom is an inspiration in their own way. Many thanks to my friend, colleague, and co-author, Christine Lissitzyn, for asking me to be involved in this project. My friend and colleague Gary Blake provided much needed assistance and support. Judge Holly Abery-Wetstone kindly shared her time and experiences, and helped me put a realistic slant on some otherwise esoteric subject matter. I am indebted to the National Computer Forensics Institute for all their assistance in educating me on the topics at hand, and to the Connecticut Forensic Science Laboratory, particularly Jill Theriault in the Firearms and Toolmarks section for her, and their, invaluable assistance. Finally, thanks to all those who kindly allowed the use of their photography, without which a much more lackluster presentation would obtain.

—MWV

Introduction

This textbook is designed to examine the process by which forensic evidence is used in the court system through case studies and the case law that has resulted when forensic evidence has been introduced. The text is designed for any student of law, criminal justice, or political science who wishes to understand both the power and the limitations of forensic evidence. The primary focus will be on criminal trials, in which forensic evidence is frequently introduced to prove one of two critical issues: (1) is the defendant the perpetrator of the crime, or (2) what happened at the crime scene?

As you will see, forensic evidence is frequently more reliable in excluding a defendant as the perpetrator (for example, the fingerprint on the weapon is not the defendant's or the blood at the scene is not the defendant's) than in positively identifying the defendant (for example, the hair sample or shoeprint at the scene is "consistent with" a class of individuals that includes the defendant but also many other individuals).

You will also learn how the rules of the U.S. court system limit the ways forensic evidence may be introduced in a trial, the types of expert "opinions" that may be offered in evidence, and the limitations on the ability of an appellate court to use its own judgment in deciding whether forensic evidence should have been introduced or excluded.

The public fascination with forensic evidence was captured with the advent of DNA testing. DNA evidence was introduced in 1995 in the trial of O.J. Simpson, in which a jury failed to convict Simpson of the murder of his wife, Nicole, and Ron Goldman, a waiter, despite a mass of DNA evidence pointing to his guilt. Due in part to the introduction of evidence that some DNA evidence may have been deliberately planted and testimony about a racist detective, the jury concluded there was "reasonable doubt" about Simpson's guilt. A different jury, in a subsequent civil trial, on virtually the same evidence, found based on a "preponderance of the evidence" that Simpson was liable in monetary damages for killing Nicole and Ron Goldman. This may be due in part to the fact that the standard of proof that a criminal jury uses requires a higher level of proof than that of a civil jury.

Television shows such as *CSI* depict detectives processing forensic evidence and getting a "hit" on a suspect. In most jurisdictions, the personnel who process forensic

evidence hold degrees in chemistry or other scientific studies and work separately from the police force. Several types of forensic evidence, such as DNA and fingerprints, are either processed by commercial laboratories, as in the case of DNA, or are processed in part by computer systems that yield reports that must be read and evaluated by a fingerprint expert before a “match” can be declared. DNA, in particular, is almost never processed overnight and the DNA backlogs in many states have led to substantial questions about the justice system’s ability to render a speedy verdict.

However, juries may expect forensic evidence and this expectation, sometimes called the “CSI effect” may present problems at trial, similar to earlier tendencies of juries to simply accept as fact the opinion of an expert witness due to the “White Coat Effect.” Today juries are sophisticated enough to realize that both the prosecution and the defense pay for their expert witnesses, who often give conflicting reports. However, many defendants who rely on public defenders may not be able to afford to pay an expert witness, which presents another access to justice issue.

In 1993, the use of forensic evidence in court was radically changed by the U.S. Supreme Court in a civil case involving whether a drug caused birth defects. This case, *Daubert v. Merrell Dow Pharmaceuticals*,¹ stated that in deciding whether to admit scientific testimony under the Federal Rules of Evidence, the party proposing to offer the evidence must show that it meets certain tests that demonstrate that it is based on the scientific method, tested, and reliable. This test subsequently was incorporated into a revised federal rule of evidence and subsequently adopted in most state rules of evidence. Therefore, it applies in almost all federal and state criminal cases today. This inquiry often requires attorneys and judges to understand the scientific method and statistics, which many do not.

Although *Daubert* was a civil case, the language of the Supreme Court opinion applies to any case — civil or criminal — in which forensic evidence is proffered. And it set off thousands of subsequent court hearings on admissibility and appeals based on convictions where the defendant contended that the evidence either should or should not have been admitted under the *Daubert* standard.

One important issue we will examine is the Supreme Court’s “alternate test” that scientific evidence can also be admitted if it is “generally accepted” in the scientific community. This has led to a dispute over defining the scientific community. Is it composed of academics or law enforcement? Another dispute is whether “generally accepted” is the same thing as “generally admitted.” As you will see when we examine handwriting analysis, expert opinions as to who wrote a questioned document have been admitted routinely for years (for example, in the trial of the Lindbergh baby kidnapping in 1935) but that does not mean that handwriting analysis has ever been subjected to the scientific method. It has been generally admitted (and continues to be) but it is not generally accepted as scientifically reliable.

Forensic evidence almost always requires an “expert witness,” someone who either processed the evidence and testifies to what he or she concluded, or an expert hired

1. 509 U.S. 579 (1993).

to evaluate the work or report of a forensic laboratory and give an opinion about what the test results mean. The expert witness must be qualified by training and/or experience before he or she can testify, which is another battleground we will examine.

The language of the opinion permitted by courts varies based on history and the ability of a jury to look at the evidence and draw their own conclusions. For example, historically, fingerprint experts have been permitted to declare that a fingerprint they have examined is a “match” to the defendant’s fingerprint and that it was made by the defendant and no one other than the defendant. Yet DNA experts typically give an opinion, for example, that the chance a DNA sample taken from a rape kit matches anyone other than the defendant is 1 in 300 million. Why this difference? You will see that in part it is because fingerprint experts were permitted to give their “match” opinion long before DNA evidence was available. The other reason is that fingerprint evidence is not used for anything other than criminal investigations, whereas DNA evidence resulted from rigorous scientific studies as the human genome was mapped. Finally, a jury is frequently shown a picture of the crime scene fingerprint and the defendant’s fingerprint. They can see for themselves the similarities. Of course, the crime scene print is frequently smudged and incomplete, so the ability of a jury to make a meaningful comparison is often impaired.

We will also look at areas of forensics that are considered “junk science,” rather than true science. Junk science is a term used for a type of forensic evidence that has not been subjected to scientific testing and validation. As we will see, the question of how much testing is sufficient is not a bright line. Polygraph, for example, is generally viewed as reliable in measuring blood pressure and sweat. But can these physical measurements correspond to truthfulness? Does the fact that polygraph reliability varies widely based on the training and experience of the person who formulates the questions mean that it is not science because it cannot be replicated by anyone? Bitemark analysis is an example of something that sounds like science, but has never been tested. Can bitemarks conclusively identify a person? Unlike fingerprints, which have been subjected to a test (albeit flawed) of 50,000 fingerprints, bitemarks have never been tested at all. Can a person be identified by his smell? This is another topic that may or may not be reliable. Do MRIs of certain areas of the brain indicate the defendant is violent or dangerous? We will examine these and similar contentions.

The U.S. Constitution bears on a number of important issues relating to forensic evidence. A major issue is whether a defendant has the right to confront and cross-examine the individual who processed a forensic sample. In the case of DNA, for example, the prosecutor generally offers a report conducted by an outside laboratory and asks an independent expert to explain its significance. The issue arose in 2009 in a case called *Melendez-Diaz v. Massachusetts*,² in which the U.S. Supreme Court held that a criminal defendant has a constitutional right to confront the lab technician who ran a forensic test used as evidence against him. The particular facts related to a test of a white substance found on the defendant and identified by a laboratory report

2. 557 U.S. 305 (2009).

entered into evidence as cocaine. In this case, the results of the report were admitted to prove a fact in issue—that the powder was cocaine—but the defendant was not able to cross-examine the analyst who tested the powder to determine what test was performed or whether the analyst used any judgment in interpreting the results.

The Supreme Court stated that forensic evidence is not immune from manipulation, particularly by scientists who may feel pressure from a law enforcement official to alter evidence in a manner favorable to the prosecution. It cited a commentator whose research showed over 60% of overturned criminal convictions involved invalid forensic testimony.³ Finally, it said that the ability to confront and cross-examine the analyst could expose incompetent analysts:

Contrary to respondent's and the dissent's suggestion, there is little reason to believe that confrontation will be useless in testing analysts' honesty, proficiency, and methodology—the features that are commonly the focus in the cross-examination of experts.⁴

This case could have far-reaching implications for an already-overburdened forensic laboratory system if individual lab technicians must leave work to testify in court. Following *Melendez-Diaz*, the Supreme Court has held that the Confrontation Clause also requires the analyst who tests blood alcohol levels⁵ to be present for cross-examination, but rejected the argument that the analyst who tests a DNA sample at an outside laboratory must appear. Although the U.S. Supreme Court in *Williams v. Illinois*⁶ later held in a plurality opinion that DNA test results were not “testimonial” and therefore did not trigger the Confrontation Clause, at least one court has restricted that opinion to its unusual facts and declined to follow it, holding that at least certain personnel involved in DNA testing must be present to testify. This issue can be expected to have widespread implications in the future.

In 2009, the National Research Council of the National Academies released a report entitled *Strengthening Forensic Science in the United States: A Path Forward* (referred to in this text as the NRC Report).⁷ The report resulted from a congressional mandate to the National Academy of the Sciences to study both research and the technical practice of the forensic science community. It was influenced, no doubt, by a widely reported decision by a federal court in Philadelphia that banned a fingerprint expert on the ground that fingerprint matching was not sufficiently scientifically reliable. Although the opinion was later withdrawn, calls for research about fingerprinting promptly ensued.

The NRC Report stated that fingerprinting and 11 other areas of forensic evidence (other than DNA) had not been sufficiently scientifically validated. It also concluded

that testing and training in forensic examination varied widely among the states. It made 13 recommendations, including the creation of a federal agency to “establish and enforce best practices for forensic science professionals and laboratories,” to be called the National Institute of Forensic Science. It called for standardized laboratory reports and terminology and the development of quantifiable measures of uncertainty in the conclusions of forensic analyses.

The report highlighted a “major problem” in the forensic science community:

The simple reality is that the interpretation of forensic evidence is not always based on scientific studies to determine its validity. This is a serious problem. Although research has been done in some disciplines, there is a notable dearth of peer-reviewed published studies establishing the scientific bases and validity of many forensic methods.⁸

Substantial funds will have to be found to conduct peer-reviewed scientific studies, studies that may be of use only to the crime enforcement community. Without support from the academic scientific community, it may be difficult to achieve the type of scientific testing this board recommended.

Subsequent to this report, Congress established an Office of Forensic Science Improvement and Support (OFSIS) to direct forensic science-related research and standard-setting. The Department of Justice is to direct accreditation, certification, and compliance enforcement of the standards set by OFSIS. As of June 26, 2014, the Department of Justice and the U.S. Commerce Department’s National Institute of Standards and Technology had named 17 academic researchers and forensic science experts to a Forensic Science Standards Board. And by May 2016, this board had issued some standards for public comment as well as a number of calls for research studies, including one for Forensic Document Examination Friction Ridge (fingerprint) analysis, and Firearms and Toolmarks.

This text will present a number of case studies in which forensic evidence was presented and contested in court. Some, such as the O.J. Simpson case, the Amanda Knox case, and the JonBenét Ramsey case may be familiar to you. Others, such as the kidnapping and murder of the Lindbergh baby, the Sam Shepherd murder trial, and the Richard Crafts “wood-chipper murder” took place before DNA profiling, yet involved forensic issues such as blood spatter analysis, crime reconstruction, and handwriting analysis. We will also refer frequently to a Connecticut “cold case,” *State v. Edward Grant*, in which Grant was convicted of murdering Penney Serra twenty-five years after the crime. The arrest and conviction were triggered by a routine run of fingerprints in cold cases through the AFIS computer fingerprint matching system.

Here is a short summary of the case of *State v. Grant*.⁹ Edward Grant was convicted in 2002 for the 1973 murder of Concetta “Penney” Serra in a New Haven, Connecticut, garage. Serra had driven her car into the garage and parked on the top floor. At some

8. NRC Report, p 8.

9. A detailed case record appears in the Appendix to this text.

point, her attacker got into her car, a fight ensued with a knife, and his blood, which was Type O, was left in the car (and in a trail throughout the garage, believed to have been left by the attacker as he looked on foot for his own car after the crime). The blood was typed but DNA profiling was not yet invented. Serra then fled across the lot and tried to escape up a staircase, which was locked at the top. Her body was found stabbed at the foot of the stairs. She was not raped and nothing was taken from her car. Based on these facts, investigators believed the murder was a “crime of passion” by someone Serra knew. They interviewed three former boyfriends and put them in a lineup for possible identification by some people who had been in the garage. A prior boyfriend of the victim was identified the following day in a lineup, but he was ruled out based on his blood type. Another was arrested and charged with the crime, but charges were dropped on the eve of trial when it turned out his blood type did not match the Type O blood trail either.

Investigators lifted one clear fingerprint from a tissue box on the floor behind the driver’s seat. The print did not match any of the fingerprints on card files in New Haven at the time. (The Automated Fingerprint Identification System, AFIS, was not yet in operation.) They also found a handkerchief four flights down in the garage, which they initially thought was unconnected to the crime. They later connected it based on a blood trail in the garage, which they believed was the attacker’s as he searched the garage trying to find his own car. Blood typing showed the victim’s blood type — A — was found where Serra was killed, but Type O blood, believed to be the attacker’s, was present in the trail and in the car.

The case remained a “cold case” for almost twenty-five years until Chris Grice, a fingerprint examiner in the Connecticut State Forensic Laboratory (who had been involved as one of the investigators in New Haven twenty-five years prior), did a cold case run of the fingerprint from the tissue box through AFIS. As we will see in the “Fingerprint Analysis” chapter, the AFIS report was a series of numbers identifying people. Grice then needed to pull actual prints and visually compare them. Ed Grant was not number 1 on the list. However, Grice eliminated the higher numerical “matches” and identified Grant as the print on the box.

The *Grant* case is unique in that the defendant was convicted based on two pieces of forensic evidence and virtually nothing else. There was no evidence that he had ever met Penney Serra. No one saw the fight in the car, Penney’s flight to the stairs, or the stabbing. The few witnesses at the time — other drivers and the garage ticket taker — were inconsistent in their descriptions of a man driving erratically in the garage. The ticket taker said he was handed a bloody parking ticket by a driver in a car that did not match any Grant ever owned and the man spoke with a foreign accent. Grant had no accent.

Grant’s attorneys did not deny that the forensic tests were accurate, but argued that there was no evidence to prove that the fingerprint was impressed on the tissue box at the time of the crime, so even if it was Grant’s, it didn’t prove he was in the car the day Serra was murdered. Nor was there any testimony that proved the handkerchief was Grant’s or that it was dropped at the time of the crime. They also

questioned how only one small spot of “blood” could have remained testable after years of investigators moving the handkerchief from place to place under conditions that deteriorated the rest of the spots beyond testing. None of these arguments were persuasive to the jury.

Grant’s main argument on appeal was that his arrest warrant lacked probable cause because it was based on a fingerprint on a moveable object — the tissue box in the car — and there was no proof that the fingerprint was placed on the tissue box at the time of the crime. The court was not persuaded and denied Grant’s appeal:

In most of the cases relied on by the defendant, the courts held that fingerprint evidence with a possible innocent explanation was insufficient to support a finding of guilt *beyond a reasonable doubt*. The mere possibility of an innocent explanation for evidence connecting a defendant with a crime does not, however, preclude a finding of probable cause.¹⁰

This text will examine the *Grant* case and many other court cases where forensic evidence has been contested in the following primary areas:

- DNA
- Fingerprints
- Firearms and Ballistics
- Toolmarks
- Computer Forensics
- Eyewitness Identification
- Blood Spatter
- Handwriting

This text will also discuss these questions:

- How does the way crime scene investigators handle evidence affect whether it is admissible in court?
- What is circumstantial evidence? Is it as good as direct evidence? Is forensic evidence direct evidence or circumstantial?
- Does a jury have to believe a forensic expert witness?
- Why does an appeals court allow an evidence ruling of a trial court to stand, even where the appeals court disagrees with the decision of the trial court?
- How can a prisoner who believes he is innocent get access to crime scene DNA for post-conviction testing?
- Is the judge better than the jury in deciding whether scientific testimony is reliable? Why not just let all forensic evidence in and let the lawyers cross-examine the opposing experts?

10. 286 Conn. 499, 518, 944 A.2d 947, 962 (2008).

- How does the Constitution apply to the defendant's right to confront and cross-examine experts who tested forensic evidence?
- When does the possible prejudice to a defendant of introducing evidence justify excluding it?
- How does the fact that a forensic fingerprint examiner must use his subjective judgment in comparing fingerprint samples affect its admissibility?
- When must an expert simply present forensic evidence to a jury (such as handwriting) and let the jury decide if it matches, rather than giving an opinion?
- How have evidentiary principles been applied to digital evidence?
- Is firearm and toolmark evidence appropriate for expert testimony?
- How have advances in psychological sciences affected the admissibility of both eyewitness identification and expert testimony on eyewitness identification?
